CAR BOTTOM FURNACE

Description:	This is a box furnace with a car bottom of a high loading capacity that can be moved independently and relatively far away from the furnace. When out of the furnace, the car bottom is loaded by a crane, manipulator or manually. The use of a car bottom furnace is particularly advantageous in buildings with an overhead crane.
Applications:	Annealing and stress relieving of large-size heavy parts (e.g. for power plants) and steel structures made of alloyed or non-alloyed steel
Buying Criteria:	Dimensions and weight of products, temperature, heat treating temperature, temperature accuracy requirement, other process parameters (heating-up and cooling times, etc.).
